

7.4 Contact Synchronization (CardDAV)

CardDAV synchronizes your LightDrive contacts with compatible applications. For a contacts-only app, open **Contacts → Mobile & app connections**, name the app or device, and create a Contacts-only client password. If the same app also connects to LightDrive email, create an Email & contacts password under **Settings → Security → App & device access**. Copy the value when LightDrive displays it; the value is shown only once.

- **Address book URL:** `https://dav.lightdrive.one/USERNAME/contacts/`
- **Username:** your full `username@lightdrive.one` address; your bare LightDrive ID is also accepted
- **Password:** the Contacts-only or Email & contacts password created for that app or device

Replace USERNAME in the URL with your LightDrive ID, using the same spelling and capitalization as your account. Enter the HTTPS address exactly and keep certificate verification enabled.

Your main Vault password, a Vault app password, and an Email-only password do not authenticate to CardDAV. Create a separate credential for each client so one can be revoked without interrupting the others.

CardDAV synchronizes contacts only. Configure CalDAV separately for calendars and IMAP/SMTP separately for email.
