5.7 Setting Up Email on Android

Before adding the account, open **Settings → Security → App & device access**, create a **LightDrive client password that includes Email** for the Android mail app, choose **Email only**, and copy it when LightDrive displays it.

Add the account to an Android mail app that supports IMAP.

- **Email/username:** your full `username@lightdrive.one` address
- **Incoming server:** `mail.lightdrive.one`, IMAP port `993`, SSL/TLS
- **Outgoing server:** `mail.lightdrive.one`, SMTP port `587`, STARTTLS
- **Authentication:** required for both servers
- **Password:** the LightDrive client password created for this app and device

Use the same LightDrive client password for incoming and outgoing mail. Your main Vault password and Vault app passwords do not authenticate to email. Do not accept an option that disables certificate checking.

Android manufacturers and mail apps use different screen names, but the server values above do not change. If automatic setup chooses another host or port, switch to manual setup and enter them exactly.
